Diagnosing, Staging, and Treating Chronic Kidney Disease in Dogs and Cats

Chronic kidney disease (CKD) is diagnosed based on evaluation of all available clinical and diagnostic information in a stable patient. Following diagnosis of CKD, the IRIS Board recommends using serum creatinine or SDMA (ideally both) to stage CKD with substaging based on assessment of arterial blood pressure and proteinuria.
Step 1: Diagnose CKD

Clinical signs and physical examination findings worsen with increasing severity of kidney disease

Clinical presentation

Consider age, sex, breed predispositions, and relevant historical information, including medication history, toxin/toxicant exposure, and diet.
Can be subclinical in early stage CKD. Signs may include polyuria, polydipsia, weight loss, decreased appetite, lethargy, dehydration, vomiting, and bad breath.

Physical examination findings

Can be normal in early stage CKD. Findings may include palpable kidney abnormalities, evidence of weight loss, dehydration, pale mucous membranes, uremic ulcers, evidence of hypertension, i.e., retinal hemorrhages/detachment.

To diagnose Stage 1 and early Stage 2 CKD
One or more of these diagnostic findings:

1

Creatinine increasing within the reference interval where no prerenal cause is apparent

SDMA increasing within the reference interval where no prerenal cause is apparent

2 Persistent increased SDMA* >14 µg/dL

3 Abnormal kidney imaging

4 Persistent renal proteinuria
UPC >0.5 in dogs; UPC >0.4 in cats

0.6	0.7	1.0
Sept '15	Oct '15	Nov '15

Urine protein to creatinine (UPC) ratio

OR

To diagnose more advanced CKD (late Stage 2–4)

Both of these diagnostic findings:

1 Increased creatinine and SDMA concentrations

Creatinine
SDMA

Results of both tests should be interpreted in light of patient's hydration status.

plus

Urine specific gravity **<1.030**

Urine specific gravity **<1.035†**

2

| 1.030	Canine	1.008
1.035	Feline	1.008

See www.iris-kidney.com for more detailed staging, therapeutic, and management guidelines.

†Note that some cats can produce hypersthenuric urine in the face of renal azotemia.

# Step 2: Stage CKD

	Stage 1 No azotemia (Normal creatinine)	Stage 2 Mild azotemia (Normal or mildly elevated creatinine)	Stage 3 Moderate azotemia	Stage 4 Severe azotemia
Creatinine in mg/dL Canine *Stage based on stable creatinine*	Less than 1.4 (125 µmol/L)	1.4–2.8 (125–250 µmol/L)	2.9–5.0 (251–440 µmol/L)	Greater than 5.0 (440 µmol/L)
Feline	Less than 1.6 (140 µmol/L)	1.6–2.8 (140–250 µmol/L)	2.9–5.0 (251–440 µmol/L)	Greater than 5.0 (440 µmol/L)
SDMA* in µg/dL Canine *Stage based on stable SDMA*	Less than 18	18–35	36–54	Greater than 54
Feline	Less than 18	18–25	26–38	Greater than 38
UPC ratio Canine *Substage based on proteinuria*	Nonproteinuric **<0.2** Borderline proteinuric **0.2–0.5** Proteinuric **>0.5**			
Feline	Nonproteinuric **<0.2** Borderline proteinuric **0.2–0.4** Proteinuric **>0.4**			
Systolic blood pressure in mm Hg *Substage based on blood pressure*	Normotensive **<140** Prehypertensive **140–159** Hypertensive **160–179** Severely hypertensive **≥180**			

Note: In the case of staging discrepancy between creatinine and SDMA, consider patient muscle mass and retesting both in 2–4 weeks. If values are persistently discordant, consider assigning the patient to the higher stage.
*SDMA = IDEXX SDMA® Test

See www.iris-kidney.com for more detailed staging, therapeutic, and management guidelines.
Step 3: Treat CKD
	Stage 1	Stage 2	Stage 3	Stage 4
Treatment recommendations	Use nephrotoxic drugs with caution	Same as Stage 1	Same as Stage 2	Same as Stage 3
	Correct prerenal and postrenal abnormalities	Renal therapeutic diet	Keep phosphorus <5.0 mg/dL (<1.6 mmol/L)	Keep phosphorus <6.0 mg/dL (<1.9 mmol/L)
	Fresh water available at all times	Treat hypokalemia in cats	Treat metabolic acidosis	Consider feeding tube for nutritional and hydration support and ease of medicating
	Monitor trends in creatinine and SDMA to document stability or progression		Consider treatment of anemia	
	Investigate for and treat underlying disease and/or complications		Treat vomiting, inappetence, and nausea	
	Treat hypertension if systolic blood pressure persistently >160 or evidence of end-organ damage		Increased enteral or subcutaneous fluids may be required to maintain hydration	
	Treat persistent proteinuria with renal therapeutic diet and medication (UPC >0.5 in dogs; UPC >0.4 in cats)		Consider calcitriol therapy in dogs	
	Keep phosphorus <4.6 mg/dL (<1.5 mmol/L)			
	If required, use renal therapeutic diet plus phosphate binder
